

COMPUTER PROGRAMMING

LAB NO: 01

LAB TITLE

Installation of DEV-C++ IDE and Execution of First C++ Program

1. OBJECTIVE

The objective of this lab is to learn how to install the DEV-C++ Integrated Development Environment (IDE) and run a basic C++ program. Students learn how to create, compile, and execute a simple C++ program using DEV-C++.

2. THEORY

C++ is a widely used programming language for developing software and engineering applications. To write and run C++ programs, a programming environment called an Integrated Development Environment (IDE) is used.

DEV-C++ is a beginner-friendly IDE that allows programmers to write, compile, and run programs easily. It provides a code editor, compiler, and output window in one place. Every C++ program begins with the `main ()` function, where the execution of the program starts. The `cout` statement is used to display output on the screen.

3. SOFTWARE

- DEV-C++ IDE
- C++ Compiler

4. PROCEDURE / PROCESS

Step 1: Install DEV-C++

1. Download DEV-C++
2. Install it
3. Open it

Step 2: Create Program

1. File → New → Source File
2. Save as lab1_hello.cpp

5. LAB TASK

• TASK NO 01

```
#include <iostream>    // input output library shamil karna
using namespace std;   // standard namespace use karna

int main()    // program yahan se start hota hai
{
    cout << "Hello World!"; // screen par message print karna
    return 0;    // program successfully end
}
```

6. GITHUB TASK

1. Create GitHub account
2. Create repository
3. Upload file
4. Share link

7. CONCLUSION

In this lab, we learned how to install the DEV-C++ IDE and create our first C++ program. We also learned how to compile and run the program successfully. Additionally, we learned how to upload lab files to GitHub for submission and record keeping.
